

LAYER 1 — CORE FLOW (Pods, Invites, Event Entry)

Fix 1: Invite Accept → Registration Conflict

Problem

Users must register even after being invited and accepting.
This creates friction and breaks expected flow.

Pass if

Invite acceptance = automatic registration
User can directly join event

Fix Direction

Remove duplicate registration step

Fix 2: Invite Permission Logic Broken

Problem

“Allow members to invite others” is enabled but does not work.

Pass if

Members can successfully invite when permission is enabled

Fix Direction

Fix permission + role logic at system level

Fix 3: Email Notification Failure (Critical Trust Issue)

Problem

Users are not receiving emails for:

- Signup
- Approval
- Poke

Impact

Breaks trust immediately (“Is the platform real?”)

Pass if

All transactional emails are reliably delivered

Fix Direction

Audit and fix email delivery system (highest priority)

Fix 4: System State Inconsistency (Architecture Issue)**Problem**

Core contradictions in system behavior:

- Permissions say one thing, system does another
- Host control exists, but system overrides
- Actions don't reflect true state

Impact

This is not UI — this is system truth breaking

Pass if

System has clear, consistent logic for:

- Who can act
- When actions happen
- What state is final truth

Fix Direction

Refactor state management (not patch-level fix)

Fix 5: Host Control Authority**Problem**

System still enforces flow (timers/end), conflicting with host control.

Pass if

Host has full control over:

- Start matching
- End rounds
- End event

Fix Direction

Remove system overrides — host is single authority

Fix 6: Post-Matching Navigation Confusion

Problem

“Try Again” sends users back to main room unexpectedly.

Pass if

Navigation is predictable and intentional

Fix Direction

Fix CTA logic and clearly define flow

LAYER 2 — UX / INTERACTION

Fix 7: Waiting Room Layout Hierarchy**Problem**

“Waiting for host” message is prioritized over camera.

Pass if

Camera is primary

Waiting message is secondary

Fix Direction

Reorder layout:

Camera → Status

Fix 8: Self-View Visibility (Critical UX Issue)**Problem**

- Self-view too small in breakout
- Poor positioning
- Not aligned with natural behavior

Impact

Breaks user comfort and immersion

Pass if

User clearly sees themselves at all times

Self-view is prominent and well-positioned

Fix Direction

Prioritize self-view (top position, larger size)

Fix 9: Mobile Camera Behavior Misaligned

Problem

Camera layout does not match how people naturally use mobile (they expect to see themselves clearly).

Pass if

Camera + self-view aligned with instinctive usage

Fix Direction

Design for human behavior, not symmetry

Fix 10: Chat UI Color & Visibility**Problem**

Chat is black → breaks visual hierarchy and readability.

Pass if

Chat matches overall UI (light/white)

Fix Direction

Update chat styling

Fix 11: Matching Start Feedback Missing**Problem**

No animation or feedback when matching begins.

Impact

No anticipation → product feels flat

Pass if

Clear transition/animation when matching starts

Fix Direction

Add animation or loading state

Fix 12: Duplicate / Conflicting Timers**Problem**

Timers appear inconsistently or duplicate system logic. The timer is placed in two different places that alerts when speaking and is unnecessary.

Pass if

Single clear timing system (preferably host-controlled)

Fix Direction

Remove redundant timers and the visuals of it

LAYER 3 — EXPERIENCE (Flow, Emotion, Trust)

Fix 14: Rating Flow Inconsistency**Problem**

- Inconsistent behavior
- Errors shown despite submission

Impact

Breaks trust in system output

Pass if

Rating is stable, clear, and reliable

Fix Direction

Fix timing, persistence, and feedback

LAYER 4 — BRAND / POLISH

Fix 19: Favicon Update**Problem**

Incorrect/outdated favicon

Pass if

Favicon matches final brand

Fix Direction

Update (Stefan to provide)
