

Main changes and fixes from this RSN test:

1. Host / Admin Logic Needs Full Separation

Right now:

Admins and super admins are automatically treated as visible hosts.

Problem:

This creates UI confusion and wrong breakout behavior.

Needed change:

A user must have three separate states:

- Participant
- Admin
- Host

Being admin should NOT automatically mean:

- visible host
- pinned big screen
- excluded from breakout rooms

New logic:

Admins/super admins should have a toggle:

“Join as host”

If OFF:

- normal participant experience
- can still access admin tools
- can join breakout rooms

If ON:

- large host screen
- visible as host
- excluded from breakout rooms
- gets host controls

This is one of the biggest architectural UX improvements discussed.

2. Multi Host Display Logic

Current issue:

Only one person properly appears as the “main” visual presence.

Needed:

If multiple hosts exist:

- multiple large host screens

OR

- host priority system

Suggested logic:

Primary Host

Co Host

Invisible Admin

Primary host should dominate visual layout. And this should be in compact section.
In normal, everyone has same camera level.

3. Matching Should ONLY Generate On “Match People”

Very important architectural clarification.

Right now:

System appears to partially pre calculate matching before host presses “Match People.”

You clarified:

Matching should ONLY populate when host explicitly presses:
“Match People”

Reason:

Late joiners must be included dynamically.

Correct flow:

- people join event
- nothing finalized
- host presses Match People
- matching engine calculates live state

This is correct product logic.

4. Late Joiner Logic

You identified a real operational scenario:
People always arrive late.

Needed behavior:

When rematching:

- include newly arrived users
- avoid duplicates if strict mode enabled
- preserve already completed rounds

System currently partially fails here.

6. Control Center UX Is Inconsistent

Shradha and Stefan saw different interfaces.

Problem:

Role rendering inconsistent.

Need:

Unified control center architecture based on role permissions.

Should clearly show:

- participant controls
- host controls
- admin controls
- room controls

Right now UI and backend permissions are desynced.

7. Audio / Mute Logic Still Broken

Problems:

- admins could not mute
- participants could not unmute
- Shradha stuck muted
- inconsistent audio state

This is still a major issue.

Needs:

Single authoritative audio state system.

Likely current issue:

frontend state mismatch vs websocket/server state.

9. Matching Logic Still Produces Duplicate/Incorrect Pairing State

Example:

Shradha personal/work accounts inconsistently matched.

Issue likely:

Matching cache or stale participant state.

Needs:

Before every rematch:

- clear old pairing map
- regenerate fresh allocation state
- rebuild participant pool

10. Trial Room / Breakout Statistics Logic Is Broken

This was the biggest backend logic issue found.

Current bug:

Statistics count rounds instead of actual unique people met.

This creates impossible outputs like:

- met 4 people
- got 5 matches

Correct logic:

People Met =

unique participant IDs interacted with

Mutual Matches =

unique people where both selected “meet again”

NOT:

number of rounds.

This is a very important analytics correction.

12. Re Rating / Duplicate Rating Issue

Problem:

If someone gets kicked/reassigned:
system asks for ratings again.

Need:

Per interaction deduplication.

Logic:

If two users already rated interaction:

- never request second rating
- unless explicitly rematched as a new conversation.

14. “Meet Everyone Again” Logic Still Unsafe

Potential issue:

System may allow repeated meetings inside same event.

You already identified earlier:

RSN should prioritize:

- new interactions first
- repeats only when unavoidable
