

LAYER 1 — CORE FLOW (Access, Registration, Event State, Matching)

Fix 1: Server Instability / Critical System Reliability

Problem

System reliability is unstable during live use.

Symptoms

- “Server failure detected” during live session
- Registration failing randomly
- System hiccup mid-flow

Pass if

Core actions work reliably during live events

Failures are handled visibly and recoverably

Fix Direction

Add proper error handling with graceful fallback

Add status monitoring

Log every failure with user, action, and timestamp

Add retry logic on key actions such as register, join, and match

Fix 2: Authentication & Session Handling

Problem

Authentication and session continuity are inconsistent.

Symptoms

- Magic link required again even after invite
- Google login not working consistently
- Users forced to re-register unexpectedly
- Different behavior across devices

Pass if

Session remains stable across devices and updates

Invite flow leads to authenticated access without extra friction

Fix Direction

Stabilize session persistence across devices

Ensure login state survives backend updates

Fix magic link logic so invite = authenticated access

Add fallback: “Already invited? Click here to join”

LAYER 2 — UX / INTERACTION

Fix 6: Host Controls Are Incomplete**Problem**

Host does not have enough control to recover from live issues.

Symptoms

- Cannot move users between rooms
- Cannot fix broken matches live
- No recovery control when something fails

Pass if

Host can intervene directly during live event issues

Fix Direction

Add host dashboard controls for:

- move users between rooms
- create room manually
- re-run matching
- pull user back to lobby

Fix 7: UI Messaging and Clarity**Problem**

Mention the number of breakout room created to all

Pass if

Participants don't need to know how many break out rooms are created. Only, host needs to be notified.

LAYER 3 — EXPERIENCE (Reliability, Media, Rating)

Fix 8: Mobile Experience Stability

Problem

Mobile behavior is unstable and incomplete.

Symptoms

- Video connection errors
- Users get logged out after retry
- UI breaks unless phone is rotated
- Missing features such as rating

Pass if

Mobile experience is stable and functionally complete

Fix Direction

Stabilize WebRTC connection handling

Do not log users out on connection failure

Force correct orientation or adapt UI properly

Ensure feature parity across devices

Fix 9: Video / Audio State Consistency

Problem

Displayed media state does not match actual media state.

Symptoms

- Host appears muted but is not
- Video connection errors during session

Pass if

UI always reflects actual audio/video state

Fix Direction

Sync UI with real media state

Add clear indicators such as:

- Muted locally
- Muted globally

Add reconnect logic for video

Fix 10: Rating System Reliability**Problem**

Rating system is inconsistent and sometimes missing.

Symptoms

- Not shown on mobile for some users
- Inconsistent availability

Pass if

Rating appears reliably after every round on all devices

Fix Direction

Make rating a mandatory step after each round

Ensure it triggers on all devices

Add fallback so missed rating appears in lobby

Fix 11: Performance Issues**Problem**

Core actions feel slow or laggy.

Symptoms

- Slow registration
- Lag during actions

Pass if

Core flows feel responsive and clearly in progress

Fix Direction

Optimize API response times

Add loading states
Preload event data before join

LAYER 4 — PRODUCT / TRUST

Fix 12: Overall Trust Problem

Problem

The current issue is not primarily UX. It is trust.

Symptoms

Users:

- can't register
- get kicked out
- can't join
- don't get matched

Pass if

Users can reliably enter, participate, and complete the flow without uncertainty

Fix Direction

Prioritize reliability before adding or refining anything else
