

RSN PLATFORM – CORE ISSUES & REQUIRED FIXES

1. STATE INTEGRITY (ROOT PROBLEM)

The system does not enforce a single source of truth for user state.

What is broken

- Users appear unregistered while registered in backend
- Users can exist in multiple states at once
- Users can be assigned to multiple rooms
- UI and backend are out of sync

Required fix

- Enforce strict state machine:

User state = one of:

- NOT_REGISTERED
- REGISTERED
- IN_LOBBY
- IN_ROOM

Rules:

- One user = one state at any time
- One user = one room only
- Backend is the single source of truth
- Frontend must always reflect backend state

2. REGISTRATION + JOIN FLOW

What is broken

- Accept invite does not reliably complete
- Backend registers user but UI shows failure or no update
- Users cannot consistently join event

Required fix

- Atomic flow:

Accept Invite → Backend success → Frontend success state

- Show clear message:
“You are registered”
- If user is REGISTERED → always allow JOIN without refresh or relogin

3. EVENT ACCESS & VISIBILITY

What is broken

- Event does not appear immediately after registration
- Requires refresh / re-login / joining pod

Required fix

- Event visibility must be tied directly to backend registration state
- No manual refresh dependency

4. ROOM ASSIGNMENT & MATCHING

What is broken

- Users can be assigned to multiple rooms
- Manual rooms conflict with auto-matching
- “Already met” logic is incorrect

Required fix

Room rules:

- User in room = locked (cannot be selected again)
- Host can only select users in lobby
- Manual and auto matching must not override each other

Matching rules:

- “Already met” applies per event only
- Reset matching history for each event
- Count as “met” only if round completed

5. BREAKOUT ROOM LOGIC

What is broken

- Rooms break on user removal
- No clear rules for edge cases

Required fix

Define exact behavior:

- 3-person room:
 - 1 leaves → remaining 2 continue

- 2-person room:
 - 1 leaves → remaining user returns to lobby
- 1-person room:
 - Define rule:
 - either allow waiting
 - or auto-return to lobby

This must be deterministic

6. EVENT CONTROL (HOST ACTIONS)

What is broken

- End round and end event behave inconsistently

Required fix

Define:

- End Round:
 - all users → lobby
- End Event:
 - terminate event
 - disable all actions

No overlap between the two

7. FEEDBACK SYSTEM

What is broken

- Not all users receive feedback prompts
- Feedback data is missing

Required fix

- Every participant must receive feedback after each round

Tracking:

- Rounds attended
- Feedback submitted per round

Fallback:

- Collect all missing feedback at event end

8. STATS & REPORTING

What is broken

- Attendance count incorrect
- Match count incorrect

Required fix

- All stats must be derived from backend logs

No UI-based counting

9. UI STATE & FEEDBACK

What is broken

- No clear system feedback
- Misleading errors
- Placeholder text visible

Required fix

- Every action must have:
 - Loading state
 - Success state
 - Error state (accurate to backend result)
- Replace/remove placeholders like:
“user and user”
