

Here are the RSN event changes from today's test:

Critical fixes

1. **Host pinning must control everyone's view**
When host pins/highlights someone, that person should become large for all participants, not only for the host. Host must also be able to make co-hosts/admins small.
2. **Create "supreme host / event director" authority**
Event host should be able to control layout and role visibility even if other people are admins. Current admin logic blocks too much.
3. **Join request approval must update live**
Pending approval did not change after approval unless refreshed.
Notifications were also unclear/missing.
4. **Matching count is wrong**
Room showed 10 or 11 participants, but only 8 matched. Some users, especially Shradha Uni and Wazim, were not matched until refresh.
5. **No repeat matches**
After rounds, the system showed people as "met one time" incorrectly and seemed to risk repeating matches. Must correctly track who has already met inside the event.

Mobile fixes

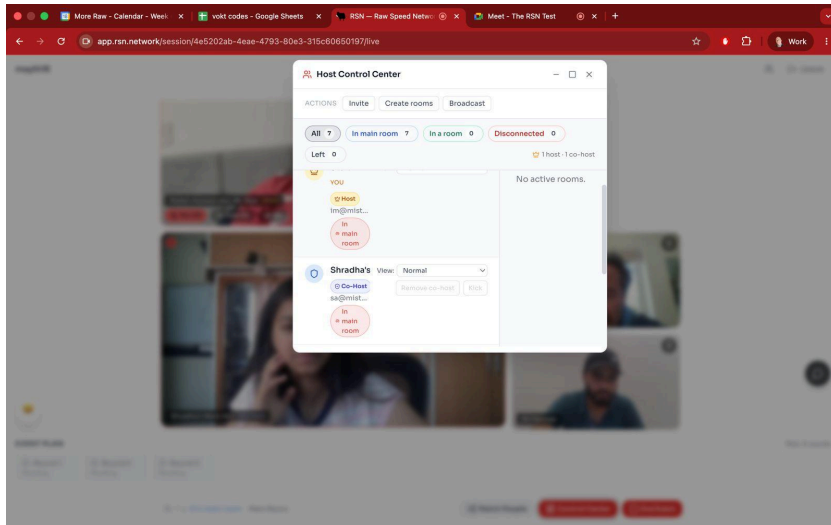

8. **Mobile compact view is not compact enough**
Normal and compact view look almost the same on mobile.
9. **Mobile chat is bad**
Breakout chat currently takes over the whole screen. It should open as a clean side panel or overlay suitable for mobile.
10. **Mobile controls have duplicated icons**
Claus saw duplicated mute/camera indicators and could not properly see himself.

Stability fixes

11. **Background effects broke video**
Adding/removing background caused black screen/page not responding for Claus.
12. **Live UI refresh is still broken**
Ali found no backend/frontend errors, but the UI does not update consistently. Server may update correctly, but frontend state gets stuck.

Smaller copy/UI fixes

13. Replace **“bye”** with **“not matched.”**
14. Clarify **host / co-host / participant switch**
Admins can switch role, but not during breakout. Make this obvious in the UI.
15. Participant counts must separate clearly:
participants, hosts, co-hosts, unmatched, matched pairs, trios.
16. Control Center for admin is messy rn, which should be fixed.

This was the problem for co host's control center: (basically, empty)
