

Review on 22nd April

1. Identity & Account Recognition

Problem

Returning users are being treated as new users and asked to sign up again.

What's happening

- Clicking an invite sometimes triggers onboarding again
- Users have to re-enter job title, profile info
- Multiple accounts (phone/laptop) create confusion and duplicates

What needs to be fixed

- Identify users strictly by email/account
- If user exists → skip onboarding completely
- Do not trigger profile completion from invite links
- Handle multi-device login as one identity (not multiple participants)

Expected result

Returning users click invite → go straight into the event/lobby. Or maybe, the onboarding is compulsorily done when they sign up for an event.

2. Invite Acceptance Flow (Critical)

Problem

Invite flow is inconsistent and unreliable.

What's happening

- Errors like “accept denied”, “failed to accept invite”
- Some users can only enter by bypassing flow
- Some get stuck after clicking accept

What needs to be fixed

- Make flow linear and single-path:
 1. Click invite
 2. Validate user
 3. Add to event
 4. Enter event/lobby

- Remove split between “accept” and “join later” if causing conflict
- One valid invite = one-click entry

Expected result

Invite works first time, consistently across devices.

3. Join → Event Visibility

Problem

Users join but don’t see the event.

What’s happening

- After joining pod, the event doesn’t appear there until refreshed the page
- Users must manually go to events menu

What needs to be fixed

- Auto-redirect user into event after join
- Refresh event state immediately after join
- Do not rely on manual navigation

Expected result

Join pod = user instantly sees event or the activities of the pod

4. Event State Sync (Major Issue)

Problem

Different users see different states unless they refresh.

What’s happening

- Some see round 2, others round 3
- Participant count inconsistent
- Manual refresh required to sync

What needs to be fixed

- Single real-time source of truth
- Push live updates for:
 - Round number
 - Room assignments
 - Participant count
 - Breakout status
- No manual refresh required

Expected result

All users see same state in real time

5. Room Assignment Integrity

Problem

Users can be placed in multiple rooms, breaking the system.

What's happening

- Same participant appears in two rooms
- Breakout fails or corrupts

What needs to be fixed

- Hard validation before round starts:
 - One user = one room
 - No duplicates allowed
- Block invalid assignments

Expected result

Invalid room assignments are impossible

6. Manual Matching Safety

Problem

Manual changes can break the event completely.

What's happening

- Manual edits caused full session breakdown

What needs to be fixed

Before saving manual match:

- Validate:
 - No duplicate users
 - Valid room structure
 - Correct participant count
- If invalid → block and show error

Expected result

Manual matching is safe and controlled

7. Breakout Transition Logic

Problem

System advances rounds without proper transition.

What's happening

- UI shows breakout started but users still in main room

What needs to be fixed

Breakout should only start if:

- Rooms created
- Users assigned
- Users successfully moved

Add explicit state steps:

- Ready → Assigned → Moved → Active

Expected result

No fake transitions. Breakout = actual breakout

8. Participant Count Accuracy

Problem

Counts are inconsistent and confusing.

What's happening

- UI shows 7 participants but actually 8
- Host inclusion unclear
- Ghost accounts affecting numbers

What needs to be fixed

Clearly define and separate:

- Active participants
- Hosts
- Waiting users
- Ghost/test accounts

Expected result

Accurate, transparent participant count

9. Roles & Permissions

Problem

Roles are unclear and not synced.

What's happening

- Pod admin $\neq$ event host
- Co-host updates don't reflect
- Permissions inconsistent

What needs to be fixed

- Separate roles clearly:
 - Pod admin
 - Event host
 - Co-host
 - Participant
- Sync role changes live (UI + permissions)

Expected result

Clear roles, correct permissions in real time

11. Session vs Historical Data

Problem

Old data is interfering with current session.

What's happening

- "Already met" triggered incorrectly

What needs to be fixed

- Separate:
 - Current event matching
 - Past event history
- Only use past data if explicitly intended

Expected result

Matching logic reflects current session only

13. Mobile Issues

Camera

- Main room camera too zoomed
- Breakout camera is better

Fix: align main room camera with breakout settings

Orientation / Mirroring

- Feels reversed or unnatural

Fix:

- Check preview vs actual video
- Fix mirroring consistency

Layout

- Need testing for 2, 3, 4 participants

14. UI Issues

Rating UI

- Wrong color (black instead of white)

Fix: align with platform theme

Event visibility

- Event not clearly shown after joining

15. Camera

Problem: the background feature doesn't work properly.

Fix: we need to make sure if we use Blur it should work.

16. Onboarding Process

This needs to be fixed and is currently under work - so we can ignore this for now.
