

## Matching Algorithm & Logic Issues

The core issue is that matches are being locked in too early.

Right now, the system saves matches at the moment they are generated. This is incorrect. Matches should only be finalized when they are actually deployed in a round.

Because of this:

- Rematching is not possible
- The system throws a **duplicate key error**
- The entire event flow breaks

This needs to be fixed at the database/logic level so that match generation is flexible until deployment.

## Event Flow Problems

The event experience feels broken in multiple places.

The **“Break between rounds” feature** creates a long and unnecessary delay after each round. This delay is confusing for users and prevents the host from starting the next round when needed. This feature does not add value and should be removed completely.

The **“Wrapping up” state** is also problematic. After the final round, the event gets stuck on this banner, and the host cannot interact with anything — including editing or adding final messages.

This should be replaced with a simple and clear **“Event Completed” state**, while still allowing the host to interact if needed.

There is also a configuration issue around time.

The current **time configuration settings are unnecessary and should be removed**, as they are adding complexity without improving the experience.

## User Experience & Interface Issues

There are several UI/UX inconsistencies that affect the overall experience.

When logging in, the screen briefly flashes black before loading the dashboard. This feels unpolished. The default background should be white to match the rest of the UI.

After creating a pod, the user is redirected back to the main pod list. This breaks the flow. Instead, the user should be taken directly inside the newly created pod.

The **favicon does not look visually balanced**, especially on the left and right edges. This needs a design fix to make it look centered and clean.

The **email invite design is inconsistent** with the platform. Some emails are still using an older colored/dark template. All emails should follow the **current white design system** for consistency.

### **Video / Waiting Room Issue**

There is a bug in the waiting room related to camera usage.

If a user turns off their camera and then turns it back on, the video does not appear again. This creates confusion and makes users think their camera is not working.

This needs to be fixed so that camera toggling works smoothly and reliably.

### **User Actions & Feedback Flow**

The current feedback system needs better logic.

When a user leaves an event (especially after a match), they should be prompted to **submit feedback**. This is important for improving match quality later. In a sense, they leave the event by choice, manually and don't wait till end.

However, it does not make sense for the **host to receive or fill out a feedback form** for an event they hosted. The host should be excluded from this flow.

### **Participant & Role Logic Issues**

There are inconsistencies in how the host is treated in the system.

The host is currently appearing under the **"Registered Participants" list**, which should not happen. The host should be treated separately.

There is also an issue where the host sees a **mutual match count**, even though they are not participating in rounds. This suggests that the host is being included in the matching pool incorrectly. This logic needs to be reviewed and cleaned up.

### **Unregister Function Issue**

The unregister button is unreliable.

Sometimes it disappears, and other times it simply does not work or works. This prevents users from leaving an event when they want to, which is a major usability issue.

This needs to be stabilized so users always have a clear and working way to exit.

### **Matching Interaction Feedback (UI)**

When the host clicks “Generate Matches,” nothing visually happens immediately.

The loading or animation only appears after clicking “Start Round,” which is too late and confusing.

There should be an **instant loading indicator or animation** as soon as “Generate Matches” is clicked, so users know the system is working.

### **System Reliability Issues**

The platform is behaving inconsistently across devices and sessions.

Some fixes appear to revert, and certain features behave differently depending on where or how the platform is accessed.

This could be due to rapid deployments without proper refresh cycles, caching issues, or version mismatches.

This needs investigation to ensure:

- Fixes persist properly
- Behavior is consistent across environments

### **Name Display Bug (Important)**

There is an issue with how user names are displayed.

This was specifically noticed with **Stefan’s name**, but the issue may be broader.

The exact behavior is unclear and needs investigation. Possible problems include:

- Names displaying incorrectly
- Duplicate names appearing
- Names not showing at all

This should be checked across different scenarios (host, participant, matching, waiting room, etc.).

## **Additional / Missed Points**

- **Edit Event Bug (Reverting Issue)**
  - The “Edit Event” functionality was previously fixed but has reverted
  - Users currently cannot edit full event properties properly
- **Invite Acceptance Inconsistency (Notification vs Email)**
  - Accepting invite from notification behaves differently than from email
  - In some cases:
    - Auto-registers user
    - Removes invite from dashboard
    - Other times it does not
  - System behaving inconsistently here
- **Profile Data Not Displaying After Registration**
  - After registering and going to profile, entered details are not visible
  - Data not being reflected properly
- **Mobile Responsiveness Issues**
  - Notifications not working properly on mobile
  - UI inconsistencies across devices
  - General responsiveness not fully stable
- **Camera Permission / Access Issue**
  - Some users did not receive camera permission popup when joining
  - Leads to inability to join properly
- **Chat Limitations (UX Gap)**
  - Cannot send emojis directly (only via workaround / mobile)
  - Minor, but affects interaction experience

- **Navigation Issue (Mobile – Chat to Meeting)**
  - Once user enters chat on mobile, unclear how to return to meeting
  - Missing clear navigation flow
  
- **Matching Button State Issue**
  - After canceling and retrying matching, system gets stuck / unclear state
  - User cannot proceed smoothly
  
- **End Round vs End Event Confusion**
  - Ending a round may unintentionally end the entire event
  - Controls are not clearly separated
  
- **Participant Count Delay / Sync Issue**
  - Participant count does not update instantly (lag when someone leaves)
  - Causes confusion during live event
  
- **Timer Behavior Issues**
  - Timer suddenly appears or behaves inconsistently
  - Should only appear at correct moment (e.g., 30 seconds before end)
  - Currently causing confusion in flow

### **Post-Rating Delay**

- After submitting rating, there is a delay before returning to main room
  - Should be instant (or handled in background)
- 
- **Host Control Blocked by Banner**
    - While “Wrapping up” banner is shown:
      - Host cannot write banner text
      - UI interaction is blocked
  
  - **Invite System Logic Gap (Advanced – Future)**

- Ability to invite **specific segments/groups (e.g., founder types)**
- Not urgent, but mentioned as a future improvement
  
- **Deployment / Flush Discussion (Not a bug, but important context)**
  - Lack of proper refresh/deployment cycle may be causing:
    - Fixes reverting
    - Inconsistent behavior
  - Suggestion (conceptual): safer system reset/refresh mechanism
