

LAYER 1 — CORE FLOW (Invites, Access, Permissions, Event Entry)

Fix 1: Invitation Email Deliverability

Problem

Invitation and reminder emails are landing in junk.

What happened

Claus did not initially receive the reminder and later found it in junk mail.

Pass if

Invites and reminders arrive in inbox reliably

Fix Direction

Improve email deliverability

Set up SPF, DKIM, DMARC

Review subject lines and wording

Use a cleaner sending domain and consistent branded sender identity

Fix 2: Approval Flow Sends Users to Login Instead of Magic Link

Problem

After approval, users are sent to a normal login page instead of getting direct access.

What happened

After approval, Stefan expected the user to enter through a magic link, but the flow pushed them to the login page.

Pass if

Approval email contains a real one-click magic link

Link authenticates user and takes them to the correct destination

No second manual login step after approval

Fix Direction

Replace login-page approval flow with direct magic-link access

Fix 3: Permission Model for Platform Invitations

Problem

Normal users can invite platform users when they should not be able to.

What happened

Stefan, using a normal non-admin account, could invite people to the platform.

Pass if

Only admin or super admin can invite platform users

Normal users can only invite where permission is explicitly allowed

Fix Direction

Restrict platform invitations to admin or super admin

Allow normal users only to:

- invite existing contacts they are already connected to
- invite within pods or contexts where permission is explicitly allowed

Fix 5: Notification State Does Not Update Properly**Problem**

Notifications remain unread even after action is taken.

What happened

After accepting in the app, the notification stayed unread until manually marked read.

Pass if

Notifications update automatically after action is completed

Fix Direction

When a user accepts or acts on an invite, notification state should auto-update correctly

LAYER 2 — UX / INTERACTION

Fix 6: Match Action**Problem**

When host clicks “match people,” nothing visibly happens, as we might be working BTS.

What happened

Stefan pressed “match people” and saw no animation, no state change, and no confirmation.

Pass if

Host has a new feature to click “matching completed”

There is a animation when we start a round.

Fix Direction

Add host feedback such as:

- Matching completed
- 3 pairs created
- Ready to start round

Fix 9: Manual Room Creation / Reassignment Controls Missing**Problem**

Host cannot manually create rooms or move participants as needed.

What happened

Stefan wanted the option to create another room and move people manually.

Pass if

Host can manually manage room assignments during live events by creating a new breakout room

Fix Direction

Add controls for:

- Create rooms

Fix 10: Host Mute State Is Incorrect After Rounds**Problem**

Displayed mute state does not match actual audio state.

What happened

After returning from a round, Stefan said his sound was on, but the interface displayed that he was muted.

Pass if

Displayed mute status always matches actual audio state

Fix Direction

Synchronize real audio state with displayed mute state
Check state reset after round transitions and room returns

LAYER 3 — EXPERIENCE (Reliability, Flow, Host Control)

Fix 12: Mobile Rating Flow Is Broken or Inconsistent

Problem

Rating screen does not always appear on mobile after the round.

What happened

Claus did not get the rating screen on mobile after the round ended and was sent straight back to the lobby.

Pass if

Rating step always appears after each round on mobile
Interrupted flows can recover instead of being skipped

Fix Direction

Make rating flow robust on mobile
Add fallback recovery for incomplete rating steps

Fix 13: Desktop and Mobile Video Connection Issue at Round Start

Problem

Video connection issue appears around timer start / round launch on desktop.

What happened

Claus reported the video connection issue appeared right when the timer started. It happened on laptop, and for other users also on mobile.

Pass if

Round starts cleanly without video instability on desktop

Fix Direction

Investigate transition handling on desktop
Check whether timer start, room join, and video initialization are colliding
Improve reconnection handling during round launch
