

The event has **5 real errors** and a few minor improvements.

Critical errors

1. Hosts are getting matched

The host/admin account got matched into rounds and received rating forms. That is wrong. Hosts should control the event, not participate unless explicitly switched into participant mode.

2. Participant counts are inconsistent

Different screens showed different numbers: 4, 5, 6, 7, 8 participants. The participant list, room count, and matching engine were not aligned.

3. Matching engine partly works, but frontend state is unreliable

The matching engine often had the right number, but the UI showed the wrong number. After round 1 or 2, some accounts stopped getting matched unless refreshed.

4. Refresh/reconnect creates bad state

-disconnected state

wrong host/admin state

wrong participant count

Important bugs

6. **Shradha Uni did not get matched**

The system could not explain why. Logs did not show the reason.

7. **Control center does not sync properly with backend**

Removing co-host status did not work clearly. Participant roles and counts did not update correctly.

8. **Create next round button disappeared**

After round 3, the button to create another round disappeared. On refresh it appeared briefly, then vanished again.

9. **Event ended on one account while still inside room**

One account showed “event ended” while still being present in the room.

10. **Background does not persist between main room and breakout room**

If a user sets a background in the main room, it does not carry into breakout rooms, and vice versa.

Minor improvements

12. **Host tiles layout**

When there are two or three hosts/co-hosts, they should appear next to each other in normal mode, not only compact mode.

13. Host should be able to unpin.
