

Here are the core changes and issues from the May 21 RSN test session:

However, the other issues and feedbacks are postponed for later :

Main fixes needed

1. **Participant count desync**

The lobby, room count, and actual participant state are inconsistent.

Examples:

- One user sees 8 members
- Another sees 5 participants
- Counts keep dropping unexpectedly
- Matching says everyone matched, but UI disagrees

This is a serious trust issue because users do not know if the system is working.

Fix:

- Single source of truth from backend
- Real time websocket sync
- UI should never cache participant count locally
- Add visible “last synced” state if latency exists

2. **Match state not updating correctly**

The system often does not show “Matched” even after successful matching.

Fix:

- Match confirmation event must trigger UI state immediately
- Add explicit states:
 - Waiting
 - Matching
 - Matched
 - Connecting
- Add fallback refresh mechanism

3. **Matching engine duplication bug**

Stefan matched with Alex repeatedly.

Ali met different people correctly, so matching memory logic is partially broken.

Fix:

- Per event “already met” tracking
- Hard prevention of repeat matches unless unavoidable
- Better fallback logic for low participant counts
